Topological and Geometrical Aspects of the Study of Projective Plane Curves

Zariski foundational paper

• O. Zariski, On the problem of existence of algebraic functions of two variables possessing a given branch curve, Amer. J. Math. **51** (1929), 305–328.

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves IUMA, Universidad de Zaragoza

Zariski foundational paper

- O. Zariski, On the problem of existence of algebraic functions of two variables possessing a given branch curve, Amer. J. Math. 51 (1929), 305–328.
- Goal: Compute $\pi_1(\mathbb{P}^2 \setminus C)$, C = F(x, y, z) = 0 of degree *d*.

Zariski foundational paper

- O. Zariski, On the problem of existence of algebraic functions of two variables possessing a given branch curve, Amer. J. Math. 51 (1929), 305–328.
- Goal: Compute $\pi_1(\mathbb{P}^2 \setminus C)$, C = F(x, y, z) = 0 of degree d.
- Choose a generic line L_0 , $L_0 \oplus C$. By Lefschetz Hyperplane Section Theorem:

 $\mathbb{F} := \langle a_1, \dots, a_{d-1} \mid _ \rangle = \langle a_1, \dots, a_d \mid a_d \cdot \dots \cdot a_2 \cdot a_1 = 1 \rangle = \pi_1(L_0 \setminus C) \twoheadrightarrow \pi_1(\mathbb{P}^2 \setminus C)$

$$f(x,y) := F(x,y,1), f \text{ monic in } y.$$

 $R := \{t \in \mathbb{C} \mid f(t, y) \text{ has no multiple root} \}$

Take a loop α in $\mathbb{C} \setminus R$ based at 0. The motion $\{L_t\}$ defined by α deform a_1, \ldots, a_d to $a_1^{\alpha}, \ldots, a_d^{\alpha}$. In $\pi_1(\mathbb{P}^2 \setminus C)$:

$$a_j = a_j^{\alpha}$$

Van Kampen proves these relations are enough.

Modern language

There is a morphism $\nabla : \pi_1(\mathbb{C} \setminus R) \to \mathbb{B}_d$. The group \mathbb{B}_d acts geometrically on the free group in a_1, \ldots, a_d

Links associated to affine curves

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves IUMA, Universidad de Zaragoza

Links associated to affine curves

Local links: Given P ∈ C singular point, 0 < ε ≪ 1: (S³_ε, K_ε), K_ε := C ∩ S³_ε is the local link of C at P. We denote it by K^P_C.

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves

Links associated to affine curves

- Local links: Given P ∈ C singular point, 0 < ε ≪ 1: (S³_ε, K_ε), K_ε := C ∩ S³_ε is the local link of C at P. We denote it by K^P_C.
- Global link: $(\mathbb{S}^3_M, K_M), K_M := C \cap \mathbb{S}^3_N$ is the link at infinity of *C*. We denote it by K_C^{∞} .

Links associated to affine curves

- Local links: Given $P \in C$ singular point, $0 < \varepsilon \ll 1$: $(\mathbb{S}^3_{\varepsilon}, K_{\varepsilon}), K_{\varepsilon} := C \cap \mathbb{S}^3_{\varepsilon}$ is the local link of *C* at *P*. We denote it by K_C^P .
- Global link: $(\mathbb{S}^3_M, K_M), K_M := C \cap \mathbb{S}^3_N$ is the link at infinity of C. We denote it by K_C^{∞} .

Theorem (Libgober)

 Δ_C divides both $\prod_{P \in \operatorname{Sing}(C)} \Delta_{K_C^P}$ and $\Delta_{K_C^{\infty}}$.

Links associated to affine curves

- Local links: Given $P \in C$ singular point, $0 < \varepsilon \ll 1$: $(\mathbb{S}^3_{\varepsilon}, K_{\varepsilon}), K_{\varepsilon} := C \cap \mathbb{S}^3_{\varepsilon}$ is the local link of *C* at *P*. We denote it by K_C^P .
- Global link: $(\mathbb{S}^3_M, K_M), K_M := C \cap \mathbb{S}^3_N$ is the link at infinity of C. We denote it by K_C^{∞} .

Theorem (Libgober)

 $\Delta_C \text{ divides both } \prod_{P \in \operatorname{Sing}(C)} \Delta_{K_C^P} \text{ and } \Delta_{K_C^{\infty}}.$

Remark

Cogolludo and Florens compute the extra factor $(\prod_{P \in \text{Sing}(C)} \Delta_{K_C^P}) / \Delta_C$.

Links associated to affine curves

- Local links: Given $P \in C$ singular point, $0 < \varepsilon \ll 1$: $(\mathbb{S}^3_{\varepsilon}, K_{\varepsilon}), K_{\varepsilon} := C \cap \mathbb{S}^3_{\varepsilon}$ is the local link of *C* at *P*. We denote it by K_C^P .
- Global link: $(\mathbb{S}_M^3, K_M), K_M := C \cap \mathbb{S}_N^3$ is the link at infinity of C. We denote it by K_C^{∞} .

Theorem (Libgober)

 $\Delta_C \text{ divides both } \prod_{P \in \operatorname{Sing}(C)} \Delta_{K_C^P} \text{ and } \Delta_{K_C^{\infty}}.$

Remark

Cogolludo and Florens compute the extra factor $(\prod_{P \in \text{Sing}(C)} \Delta_{K_C^P}) / \Delta_C$.

Remark

If $C = f^{-1}(0)$ is smooth and K_C^{∞} is isotopic to $K_{f^{-1}(t)}^{\infty}$, *t* small, then K_C^{∞} determines the topology of (\mathbb{C}^2, C) (Neumann) and $\pi_1(\mathbb{C}^2 \setminus C) \cong \mathbb{Z}$ (Kaliman).

Topological and Geometrical Aspects of the Study of Projective Plane Curves

E. Artal

• Characteristic varieties are defined over \mathbb{Z} .

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves IUMA, Universidad de Zaragoza

- Characteristic varieties are defined over Z.
- Let $\sigma \neq \mathbf{1}$ a torsion element of T_H of order $\ell > 1$

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves

- Characteristic varieties are defined over Z.
- Let $\sigma \neq \mathbf{1}$ a torsion element of T_H of order $\ell > 1$
- ρ is associated to a cyclic ℓ -fold covering $\rho_{\sigma}: X_{\sigma} \to Y$

- Characteristic varieties are defined over Z.
- Let $\sigma \neq \mathbf{1}$ a torsion element of T_H of order $\ell > 1$
- ρ is associated to a cyclic ℓ -fold covering $\rho_{\sigma}: X_{\sigma} \to Y$
- There is a natural decomposition of $H^1(X_{\sigma}; \mathbb{C}) = \bigoplus_{i=0}^{\ell-1} H_{\sigma^i}$

Properties

- Characteristic varieties are defined over Z.
- Let $\sigma \neq \mathbf{1}$ a torsion element of T_H of order $\ell > 1$
- ρ is associated to a cyclic ℓ -fold covering $\rho_{\sigma}: X_{\sigma} \to Y$
- There is a natural decomposition of $H^1(X_{\sigma}; \mathbb{C}) = \bigoplus_{i=0}^{\ell-1} H_{\sigma^i}$
- $\sigma \in V_k(G) \Leftrightarrow \dim H_{\sigma} \geq k.$

In general, it is very expensive to compute the characteristic varieties of a group. In case of $\pi_1(\mathbb{C}^2 \setminus C)$ or $\pi_1(\mathbb{P}^2 \setminus C)$ it is also expensive to compute it in terms of *C*. Libgober's theory of quasiadjunction polytopes provide a way to compute the characteristic varieties of $\pi_1(\mathbb{P}^2 \setminus C)$ in terms of superabondance of some linear systems associated to the singularities of *C*.

In general, it is very expensive to compute the characteristic varieties of a group. Libgober's theory of quasiadjunction polytopes provide a way to compute the characteristic varieties of $\pi_1(\mathbb{P}^2 \setminus C)$ in terms of superabondance of some linear systems associated to the singularities of *C*.

Theorem

Let $C = C_1 \cup \cdots \cup C_r$ be the irreducible decomposition of a curve, $G := \pi_1(\mathbb{P}^2 \setminus \mathbb{C})$. Then, the non-coordinate irreducible components of $V_k(G)$ can be computed using quasiadjunction polytopes of the singular points of C.

In general, it is very expensive to compute the characteristic varieties of a group. In case of $\pi_1(\mathbb{C}^2 \setminus C)$ or $\pi_1(\mathbb{P}^2 \setminus C)$ it is also expensive to compute it in terms of *C*. Libgober's theory of quasiadjunction polytopes provide a way to compute the characteristic varieties of $\pi_1(\mathbb{P}^2 \setminus C)$ in terms of superabondance of some linear systems associated to the singularities of *C*.

Theorem

Let $C = C_1 \cup \cdots \cup C_r$ be the irreducible decomposition of a curve, $G := \pi_1(\mathbb{P}^2 \setminus \mathbb{C})$. Then, the non-coordinate irreducible components of $V_k(G)$ can be computed using quasiadjunction polytopes of the singular points of C.

Remark

As in the case of Alexander polynomial, nodal points are irrelevant.

In general, it is very expensive to compute the characteristic varieties of a group. Remark

E. Artal

As in the case of Alexander polynomial, nodal points are irrelevant.

Example (A., Cogolludo, Tokunaga)

Let C_1 be a smooth conic and C_2 be an irreducible quartic, such that C_1 and C_2 intersect tangentially at four points. Let $C := C_1 \cup C_2$; then $V_1(\pi_1(\mathbb{P}^2 \setminus C))$ is trivial if C_2 is smooth but it has a non trivial point if C_2 has 3 nodes.

Orbifold

An orbifold X_{φ} is a quasiprojective Riemann surface X with a function $\varphi : X \to \mathbb{N}$ with value 1 outside a finite number of points.

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves IUMA, Universidad de Zaragoza

Orbifold

E. Artal

An orbifold X_{φ} is a quasiprojective Riemann surface X with a function $\varphi : X \to \mathbb{N}$ with value 1 outside a finite number of points.

Orbifold group

For an orbifold X_{φ} , let p_1, \ldots, p_n the points such that $\varphi(p_j) := m_j > 1$. Then

$$\pi_1^{\text{orb}} := \pi_1(X \setminus \{p_1, \dots, p_n\}) / \langle \mu_j^{m_j} = 1 \rangle$$

where μ_j is a meridian of p_j . We denote X_{φ} by $X_{m_1,...,m_n}$.

Orbifold

An orbifold X_{φ} is a quasiprojective Riemann surface X with a function $\varphi : X \to \mathbb{N}$ with value 1 outside a finite number of points.

Orbifold group

For an orbifold X_{φ} , let p_1, \ldots, p_n the points such that $\varphi(p_j) := m_j > 1$. Then

$$\pi_1^{\text{orb}} := \pi_1(X \setminus \{p_1, \dots, p_n\}) / \langle \mu_j^{m_j} = 1 \rangle$$

where μ_j is a meridian of p_j . We denote X_{φ} by $X_{m_1,...,m_n}$.

Definition

E. Artal

A dominant algebraic morphism $\rho : Y \to X$ defines an orbifold morphism $Y \to X_{\varphi}$ if for all $p \in X$, the divisor $\rho^*(p)$ is an *n*-multiple.

イロト イポト イヨト イヨト

Example

If *C* is a reduced curve with equation $f_2^3 - f_3^2 = 0$, f_j homogeneous of degree *j*, then the mapping $\mathbb{P}^2 \setminus C \to \mathbb{P}^1 \setminus \{1\}$, given by $x \mapsto \frac{f_2^3(x)}{f_3^2}$, defines an orbifold morphism for $\varphi(0) = 3$ and $\varphi(\infty) = 2$.

Example

If *C* is a reduced curve with equation $f_2^3 - f_3^2 = 0$, f_j homogeneous of degree *j*, then the mapping $\mathbb{P}^2 \setminus C \to \mathbb{P}^1 \setminus \{1\}$, given by $x \mapsto \frac{f_2^3(x)}{f_3^2}$, defines an orbifold morphism for $\varphi(0) = 3$ and $\varphi(\infty) = 2$.

Example

E. Artal

 $G := \pi_1^{\text{orb}}(\mathbb{C}_{2,3}) = \mathbb{Z}/2\mathbb{Z} * \mathbb{Z}/3\mathbb{Z}, H = \mathbb{Z}/6\mathbb{Z}, T_H = \{\zeta \in \mathbb{C}^* \mid \zeta^6 = 1\} \text{ and } V_1(G) \text{ consists of } \{\exp(\pm \frac{2i\pi}{6})\}.$

Example

If *C* is a reduced curve with equation $f_2^3 - f_3^2 = 0$, f_j homogeneous of degree *j*, then the mapping $\mathbb{P}^2 \setminus C \to \mathbb{P}^1 \setminus \{1\}$, given by $x \mapsto \frac{f_2^3(x)}{f_3^2}$, defines an orbifold morphism for $\varphi(0) = 3$ and $\varphi(\infty) = 2$.

Example

 $G := \pi_1^{\operatorname{orb}}(\mathbb{C}_{2,3}) = \mathbb{Z}/2\mathbb{Z} * \mathbb{Z}/3\mathbb{Z}, H = \mathbb{Z}/6\mathbb{Z}, T_H = \{\zeta \in \mathbb{C}^* \mid \zeta^6 = 1\} \text{ and } V_1(G) \text{ consists of } \{\exp(\pm \frac{2i\pi}{6})\}.$

Example

E. Artal

 $G := \mathbb{F}_k = k > 1, T_H = V_1(G) = (\mathbb{C}^*)^k.$

IUMA, Universidad de Zaragoza

E. Artal

Let G be the fundamental group of a quasiprojective manifold X.

Theorem (Arapura)

Let Σ be an irreducible component of $V_1(G)$. Then,

- If dim $\Sigma > 0$ then there exists a surjective morphism $\rho : X \to C$, C algebraic curve, and a torsion element σ such that $\Sigma = \sigma \rho^* (H^1(C; \mathbb{C}^*))$.
- If dim $\Sigma = 0$ then Σ is unitary.

Let *G* be the fundamental group of a quasiprojective manifold *X*. Following ideas coming from works of Delzant, Simpson or Dimca, we prove

E. Artal Topological and Geometrical Aspects of the Study of Projective Plane Curves IUMA, Universidad de Zaragoza

Let *G* be the fundamental group of a quasiprojective manifold *X*. Following ideas coming from works of Delzant, Simpson or Dimca, we prove

Theorem (A., Cogolludo)

Let Σ be an irreducible component of $V_1(G)$. Then one of the two following statements holds:

- There exists a surjective orbifold morphism $\rho : X \to C_{\varphi}$ and an irreducible component Σ_1 of $V_1(\pi_1^{orb}(C_{\varphi}))$ such that $\Sigma = \rho^*(\Sigma_1)$.
- **\Sigma** consists of a torsion point.

Let *G* be the fundamental group of a quasiprojective manifold *X*. Following ideas coming from works of Delzant, Simpson or Dimca, we prove

Theorem (A., Cogolludo)

Let Σ be an irreducible component of $V_1(G)$. Then one of the two following statements holds:

- There exists a surjective orbifold morphism $\rho : X \to C_{\varphi}$ and an irreducible component Σ_1 of $V_1(\pi_1^{orb}(C_{\varphi}))$ such that $\Sigma = \rho^*(\Sigma_1)$.
- **\Sigma** consists of a torsion point.

Remark

Finite cyclic coverings determine $V_1(G)$

Let *G* be the fundamental group of a quasiprojective manifold *X*. Following ideas coming from works of Delzant, Simpson or Dimca, we prove

Theorem (A., Cogolludo)

Let Σ be an irreducible component of $V_1(G)$. Then one of the two following statements holds:

- There exists a surjective orbifold morphism $\rho : X \to C_{\varphi}$ and an irreducible component Σ_1 of $V_1(\pi_1^{orb}(C_{\varphi}))$ such that $\Sigma = \rho^*(\Sigma_1)$.
- **\Sigma** consists of a torsion point.

Remark

Finite cyclic coverings determine $V_1(G)$

Example

Let C_1 be a quintic curve having three \mathbb{A}_4 singular points. Degtyarev proved that its fundamental group is finite and non abelian of order 320. Let *C* be the union of C_1 and a tangent line to a singular point. Then, the Alexander polynomial of *C* is $t^4 - t^3 + t^2 - t + 1$ but the points in the characteristic variety cannot come from a morphism onto an orbifold.
