Jaca, June 24, 2009 – Lib60ber

# The boundary of an isolated singularity

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of**  $(X, x)$

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of  $(X, x)$**

$M(X)$  is a smooth oriented closed manifold, which doesn't depend on the choices up to isotopy.

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of  $(X, x)$**

$M(X)$  is a smooth oriented closed manifold, which doesn't depend on the choices up to isotopy.

Proposition (Milnor,...)

*One has :  $(X, x) \simeq Cone(M(X), *)$ .*

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of  $(X, x)$**

$M(X)$  is a smooth oriented closed manifold, which doesn't depend on the choices up to isotopy.

## Proposition (Milnor,...)

*One has :  $(X, x) \simeq \text{Cone}(M(X), *)$ .*

*In particular, the boundary  $M(X)$  determines the topological type of the germ  $(X, x)$ .*

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of  $(X, x)$**

$M(X)$  is a smooth oriented closed manifold, which doesn't depend on the choices up to isotopy.

## Proposition (Milnor,...)

*One has :  $(X, x) \simeq \text{Cone}(M(X), *)$ .*

*In particular, the boundary  $M(X)$  determines the topological type of the germ  $(X, x)$ .*

It is false analytically in general:

# The boundary of an isolated singularity

$(X, x) \subset (\mathbb{C}^N, 0)$  : a germ of complex analytic variety having an isolated singularity.

- $M(X) := (X, x) \cap S_\varepsilon^{2N-1}$  : the **boundary of  $(X, x)$**

$M(X)$  is a smooth oriented closed manifold, which doesn't depend on the choices up to isotopy.

## Proposition (Milnor,...)

*One has :  $(X, x) \simeq \text{Cone}(M(X), *)$ .*

*In particular, the boundary  $M(X)$  determines the topological type of the germ  $(X, x)$ .*

It is false analytically in general:

## Example (Brieskorn)

There is an infinite family of non conjugated hypersurface germs

$X_p = f_p^{-1}(0) \subset (\mathbb{C}^{2n+2}, 0)$  such that  $M(X_p) \simeq S^{4n+1}$  for all  $p$ .

# Singular fillings

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

- Any connected sum  $\#_k(S^2 \times S^1)$  is not singularly fillable (Neumann).

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

- Any connected sum  $\#_k(S^2 \times S^1)$  is not singularly fillable (Neumann).
- $\mathbb{T}^3$  is not singularly fillable (Sullivan)

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

- Any connected sum  $\#_k(S^2 \times S^1)$  is not singularly fillable (Neumann).
- $\mathbb{T}^3$  is not singularly fillable (Sullivan)

## Question

Can one describe the singularly fillable  $2n - 1$  manifolds ?

# Singular fillings

## Definition

A smooth oriented closed manifold is *singularly fillable* if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

- Any connected sum  $\#_k(S^2 \times S^1)$  is not singularly fillable (Neumann).
- $\mathbb{T}^3$  is not singularly fillable (Sullivan)

## Question

Can one describe the singularly fillable  $2n - 1$  manifolds ?

- in dimension 3 : **yes** (Neumann)

# Singular fillings

## Definition

A smooth oriented closed manifold is **singularly fillable** if it is diffeomorphic to the boundary  $M(X)$  of a singular point  $(X, x)$ .

## Example

- Any connected sum  $\#_k(S^2 \times S^1)$  is not singularly fillable (Neumann).
- $\mathbb{T}^3$  is not singularly fillable (Sullivan)

## Question

Can one describe the singularly fillable  $2n - 1$  manifolds ?

- in dimension 3 : **yes** (Neumann)
- in higher dimensions : **not yet in general**. But there are necessary conditions on the cohomology ring (Hain&Durfee, Popescu-Pampu).

# Possible enrichment of the boundary: CR structure

## Possible enrichment of the boundary: CR structure

- $\xi(X) := T_{M(X)}X \cap i \cdot T_{M(X)}X$  : the complex tangencies distribution on  $M(X)$ . It is an hyperplane distribution on  $M(X)$ .

## Possible enrichment of the boundary: CR structure

- $\xi(X) := T_{M(X)}X \cap i \cdot T_{M(X)}X$  : the complex tangencies distribution on  $M(X)$ . It is an hyperplane distribution on  $M(X)$ .
- $J_X : \xi(X) \rightarrow \xi(X)$ ,  $v \mapsto i \cdot v$  : complex multiplication on  $\xi(X)$ .

## Possible enrichment of the boundary: CR structure

- $\xi(X) := T_{M(X)}X \cap i \cdot T_{M(X)}X$  : the complex tangencies distribution on  $M(X)$ . It is an hyperplane distribution on  $M(X)$ .
- $J_X : \xi(X) \rightarrow \xi(X)$ ,  $v \mapsto i \cdot v$  : complex multiplication on  $\xi(X)$ .

### Proposition (Scherk)

*The CR-manifold  $(M(X), \xi(X), J_X)$  is NOT invariant w.r.t the choices, BUT completely determines the analytical type of  $(X, x)$ .*

# Possible enrichment of the boundary: contact structure

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

### Proposition (Varchenko)

*The pair  $(M(X), \xi(X))$  is a contact manifold, independent on the choices up to isotopy. It is the **contact boundary** of  $(X, x)$ .*

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

### Proposition (Varchenko)

*The pair  $(M(X), \xi(X))$  is a contact manifold, independent on the choices up to isotopy. It is the **contact boundary** of  $(X, x)$ .*

Idea of the proof:

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

### Proposition (Varchenko)

*The pair  $(M(X), \xi(X))$  is a contact manifold, independent on the choices up to isotopy. It is the **contact boundary** of  $(X, x)$ .*

Idea of the proof:

- The distance function to  $x$   $\rho : X \rightarrow \mathbb{R}_+$  is **strictly pseudo-convex**: the complex tangencies  $\xi(X_r)$  on its smooth levels  $X_r = \rho^{-1}(r)$  then form a contact structure.

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

### Proposition (Varchenko)

*The pair  $(M(X), \xi(X))$  is a contact manifold, independent on the choices up to isotopy. It is the **contact boundary** of  $(X, x)$ .*

Idea of the proof:

- The distance function to  $x$   $\rho : X \rightarrow \mathbb{R}_+$  is **strictly pseudo-convex**: the complex tangencies  $\xi(X_r)$  on its smooth levels  $X_r = \rho^{-1}(r)$  then form a contact structure.
- **Gray's theorem**: any smooth 1-parameter family of contact structures on the same closed manifold comes from a contact isotopy.

## Possible enrichment of the boundary: contact structure

**Contact structure on a  $(2n - 1)$ -manifold:** hyperplane distribution with maximal non-integrability condition.

### Proposition (Varchenko)

*The pair  $(M(X), \xi(X))$  is a contact manifold, independent on the choices up to isotopy. It is the **contact boundary** of  $(X, x)$ .*

Idea of the proof:

- The distance function to  $x$   $\rho : X \rightarrow \mathbb{R}_+$  is **strictly pseudo-convex**: the complex tangencies  $\xi(X_r)$  on its smooth levels  $X_r = \rho^{-1}(r)$  then form a contact structure.
- **Gray's theorem**: any smooth 1-parameter family of contact structures on the same closed manifold comes from a contact isotopy.

### Definition

*A smooth oriented closed contact manifold is **singularly fillable** if it is contactomorphic to the contact boundary  $(M(X), \xi(X))$  of a singular point  $(X, x)$ .*

# A natural question

# A natural question

## Question

What does the knowledge of the contact boundary give more than that of the boundary alone?

# A natural question

## Question

What does the knowledge of the contact boundary give more than that of the boundary alone?

- For singularities of dimension  $\geq 3$ : **something in general**

# A natural question

## Question

What does the knowledge of the contact boundary give more than that of the boundary alone?

- For singularities of dimension  $\geq 3$ : **something in general**

## Theorem (Ustilovsky)

*For all  $n \geq 2$  the infinite family of contact boundaries of the hypersurface singularities  $(X_p, 0) \subset (\mathbb{C}^{2n+2}, 0)$  are pairwise non isomorphic, thus giving infinitely many different contact structures on the sphere  $S^{4n+1}$ .*

**One has to find another way to construct contact manifolds from surface singularities**

# The Milnor boundary of a germ of application

# The Milnor boundary of a germ of application

To any analytic germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  of complete intersection defining a surface singularity, one can associate the Milnor fibre

$$F_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap B_{\varepsilon}^{2p+4}$$

# The Milnor boundary of a germ of application

To any analytic germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  of complete intersection defining a surface singularity, one can associate the Milnor fibre

$$F_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap B_{\varepsilon}^{2p+4}$$

and its boundary

$$M_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap S_{\varepsilon}^{2p+3},$$

with  $0 < \|\eta\| \ll \varepsilon \ll 1$  and  $\eta \notin \text{Disc}(f)$ .

# The Milnor boundary of a germ of application

To any analytic germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  of complete intersection defining a surface singularity, one can associate the Milnor fibre

$$F_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap B_{\varepsilon}^{2p+4}$$

and its boundary

$$M_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap S_{\varepsilon}^{2p+3},$$

with  $0 < \|\eta\| \ll \varepsilon \ll 1$  and  $\eta \notin \text{Disc}(f)$ .

**Problem** : generally this depends on the choices.

# The Milnor boundary of a germ of application

To any analytic germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  of complete intersection defining a surface singularity, one can associate the Milnor fibre

$$F_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap B_{\varepsilon}^{2p+4}$$

and its boundary

$$M_{\varepsilon, \eta}(f) := f^{-1}(\eta) \cap S_{\varepsilon}^{2p+3},$$

with  $0 < \|\eta\| \ll \varepsilon \ll 1$  and  $\eta \notin \text{Disc}(f)$ .

**Problem** : generally this depends on the choices.

## Example (Lê)

For  $f : (x, y, z, t) \mapsto (xy + z^2, x)$ , one has  $\text{Disc}(f) = \{(0, 0)\}$ , but  $M_{\varepsilon, (\alpha, 0)} \simeq S^3 \amalg S^3$  and  $M_{\varepsilon, (0, \alpha)} \simeq S^3$

# The Milnor boundary of a germ of application (continued)

## Proposition

If the germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  satisfies Thom's  $a_f$ -condition, then the *Milnor fibre*  $F(f)$  and the *Milnor boundary*  $M(f)$  are well defined oriented compact manifolds up to diffeomorphism.

# The Milnor boundary of a germ of application (continued)

## Proposition

If the germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  satisfies Thom's  $a_f$ -condition, then the *Milnor fibre*  $F(f)$  and the *Milnor boundary*  $M(f)$  are well defined oriented compact manifolds up to diffeomorphism.

For instance, any (non zero) germ  $f : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  satisfies this condition.

# The Milnor boundary of a germ of application (continued)

## Proposition

If the germ  $f : (\mathbb{C}^{p+2}, 0) \rightarrow (\mathbb{C}^p, 0)$  satisfies Thom's  $a_f$ -condition, then the *Milnor fibre*  $F(f)$  and the *Milnor boundary*  $M(f)$  are well defined oriented compact manifolds up to diffeomorphism.

For instance, any (non zero) germ  $f : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  satisfies this condition.

## Proposition

The complex tangencies give a contact structure  $\xi(f)$  on the Milnor boundary  $M(f)$ , well defined up to contact isotopy. This is the *contact Milnor boundary*  $(M(f), \xi(f))$  of  $f$

# Milnor fillings

# Milnor fillings

## Definition

An oriented smooth (*contact*) closed manifold is (*smoothly*) *Milnor fillable* if it is diffeomorphic to the (*contact*) Milnor boundary of a germ  $f : (\mathbb{C}^{p+n}, 0) \rightarrow (\mathbb{C}^p, 0)$ .

# Milnor fillings

## Definition

An oriented smooth (*contact*) closed manifold is (*smoothly*) *Milnor fillable* if it is diffeomorphic to the (*contact*) Milnor boundary of a germ  $f : (\mathbb{C}^{p+n}, 0) \rightarrow (\mathbb{C}^p, 0)$ .

## Example

# Milnor fillings

## Definition

An oriented smooth (contact) closed manifold is (smoothly) Milnor fillable if it is diffeomorphic to the (contact) Milnor boundary of a germ  $f : (\mathbb{C}^{p+n}, 0) \rightarrow (\mathbb{C}^p, 0)$ .

## Example

- The lens spaces  $L(2k, 1)$  are (smoothly) Milnor fillable : one has  $L(2k, 1) \simeq M(xy^k + z^2)$  (Michel, Pichon, Weber).

# Milnor fillings

## Definition

An oriented smooth (contact) closed manifold is (smoothly) Milnor fillable if it is diffeomorphic to the (contact) Milnor boundary of a germ  $f : (\mathbb{C}^{p+n}, 0) \rightarrow (\mathbb{C}^p, 0)$ .

## Example

- The lens spaces  $L(2k, 1)$  are (smoothly) Milnor fillable : one has  $L(2k, 1) \simeq M(xy^k + z^2)$  (Michel, Pichon, Weber).
- Any connected sum  $\# S^2 \times S^1$  is (smoothly) Milnor fillable : one has

$$\#_k S^2 \times S^1 \simeq M(x^{k+1} + y^2).$$

# Milnor fillings

## Definition

An oriented smooth (contact) closed manifold is (smoothly) Milnor fillable if it is diffeomorphic to the (contact) Milnor boundary of a germ  $f : (\mathbb{C}^{p+n}, 0) \rightarrow (\mathbb{C}^p, 0)$ .

## Example

- The lens spaces  $L(2k, 1)$  are (smoothly) Milnor fillable : one has  $L(2k, 1) \simeq M(xy^k + z^2)$  (Michel, Pichon, Weber).
- Any connected sum  $\# S^2 \times S^1$  is (smoothly) Milnor fillable : one has  $\#_k S^2 \times S^1 \simeq M(x^{k+1} + y^2)$ .
- $\mathbb{T}^3$  is (smoothly) Milnor fillable : one has  $\mathbb{T}^3 \simeq M(xyz)$ .

  - other relations : **???**

## Question

Is any singularly fillable 3-manifold also (smoothly) Milnor fillable?

- In higher dimensions, **the three notions are pairwise distinct**: there are incompatible (in general) necessary (co)homological conditions for these three fillabilities to hold (Bungart, Durfee&Hain, Popescu-Pampu)

# Different fillable contact structures on the same 3-manifold

# Different fillable contact structures on the same 3-manifold

Fix any  $k > 2$ .

# Different fillable contact structures on the same 3-manifold

Fix any  $k > 2$ .

- $X_{2k,1} := \mathbb{C}^2 / (x,y) \sim (\zeta_k x, \zeta_k y)$  : a cyclic quotient singularity

# Different fillable contact structures on the same 3-manifold

Fix any  $k > 2$ .

- $X_{2k,1} := \mathbb{C}^2 / (x,y) \sim (\zeta_k x, \zeta_k y)$  : a cyclic quotient singularity
- $f_k(x, y, z) := xy^k + z^2$

# Different fillable contact structures on the same 3-manifold

Fix any  $k > 2$ .

- $X_{2k,1} := \mathbb{C}^2 / (x,y) \sim (\zeta_k x, \zeta_k y)$  : a cyclic quotient singularity
- $f_k(x, y, z) := xy^k + z^2$

## Proposition

*The contact boundaries  $(M(X_{2k,1}), \xi(X_{2k,1}))$  and  $(M(f_k), \xi(f_k))$  are both diffeomorphic to the lens space  $L(2k, 1)$ , but are **not** contactomorphic.*

# Proof

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial.

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

whatever identification  $L(2k, 1) \simeq M(f_k)$  is made.

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

whatever identification  $L(2k, 1) \simeq M(f_k)$  is made.

- $\tilde{X} \rightarrow X_{2k,1}$  : minimal good resolution.

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

whatever identification  $L(2k, 1) \simeq M(f_k)$  is made.

- $\tilde{X} \rightarrow X_{2k,1}$  : minimal good resolution.

$$T\tilde{X}|_{M(X_{2k,1})} = \xi(X_{2k,1}) \oplus \mathbb{C}\nu, \quad (\nu : \text{outward normal vector field to } M(X_{2k,1}) \subset \tilde{X})$$

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

whatever identification  $L(2k, 1) \simeq M(f_k)$  is made.

- $\tilde{X} \rightarrow X_{2k,1}$  : minimal good resolution.

$$T\tilde{X}|_{M(X_{2k,1})} = \xi(X_{2k,1}) \oplus \mathbb{C}\nu, \quad (\nu : \text{outward normal vector field to } M(X_{2k,1}) \subset \tilde{X})$$

$\tilde{X}$ : disk bundle over  $E \simeq S^2$ , with Chern class  $-2k \in H^2(E) \simeq H^2(\tilde{X}) \simeq \mathbb{Z}$ .

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

whatever identification  $L(2k, 1) \simeq M(f_k)$  is made.

- $\tilde{X} \rightarrow X_{2k,1}$  : minimal good resolution.

$$T\tilde{X}|_{M(X_{2k,1})} = \xi(X_{2k,1}) \oplus \mathbb{C}\nu, \quad (\nu : \text{outward normal vector field to } M(X_{2k,1}) \subset \tilde{X})$$

$\tilde{X}$ : disk bundle over  $E \simeq S^2$ , with Chern class  $-2k \in H^2(E) \simeq H^2(\tilde{X}) \simeq \mathbb{Z}$ .

$$c_1(\tilde{X}) = c_1(T\tilde{X}|_E) = c_1(TE) + c_1(N_{E/\tilde{X}}) = 2 + (-2k)$$

# Proof

We will distinguish  $\xi(X_{2k,1})$  and  $\xi(f_k)$  by their first Chern class.

- The complex distribution  $\xi(f_k)$  on  $M(f_k)$  is induced by the complex structure on the Milnor fibre  $F(f_k)$ , which is stably trivial. Therefore

$$c_1(\xi(f_k)) = 0 \in H^2(L(2k, 1))$$

- Use Giroux's theorem.

# Milnor open books in the Milnor boundary of a function

## Milnor open books in the Milnor boundary of a function

Let  $f : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  be a germ of analytic function. How to describe the Milnor contact boundary  $(M(f), \xi(f))$ ?

# Milnor open books in the Milnor boundary of a function

Let  $f : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  be a germ of analytic function. How to describe the Milnor contact boundary  $(M(f), \xi(f))$ ?

## Proposition

If the germ  $g : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  defines with  $f$  an isolated complete intersection singularity in  $\mathbb{C}^3$ , then for  $1 \gg \varepsilon \gg |s| > 0$  the restriction

$$\arg g_{\varepsilon, s} : M_{\varepsilon, s}(f) \setminus (M_{\varepsilon, s}(f) \cap V(g)) \rightarrow S^1$$

defines an open book decomposition which carries the natural contact structure on the Milnor boundary of  $f$ . This is the *Milnor open book of  $g$*  in the Milnor boundary of  $f$ .

# Milnor open books in the Milnor boundary of a function

Let  $f : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  be a germ of analytic function. How to describe the Milnor contact boundary  $(M(f), \xi(f))$ ?

## Proposition

If the germ  $g : (\mathbb{C}^3, 0) \rightarrow (\mathbb{C}, 0)$  defines with  $f$  an isolated complete intersection singularity in  $\mathbb{C}^3$ , then for  $1 \gg \varepsilon \gg |s| > 0$  the restriction

$$\arg g_{\varepsilon, s} : M_{\varepsilon, s}(f) \setminus (M_{\varepsilon, s}(f) \cap V(g)) \rightarrow S^1$$

defines an open book decomposition which carries the natural contact structure on the Milnor boundary of  $f$ . This is the **Milnor open book of  $g$**  in the Milnor boundary of  $f$ .

## Example

The restriction of  $z$  to the Milnor boundary  $M(x^{2l+1} + y^2)$  defines the open book  $(\Sigma_{l,1}, Id)$ . Unfortunately,  $\#(S^2 \times S^1)$  admits only one tight contact structure up to isotopy (Eliashberg, Colin). So this is the one carried by this open book.
