Midwest Topology Seminar

The ring cooperations for 2-primary tmf
Mark Behrens (University of Notre Dame)

Abstract: This talk represents joint work with Kyle Ormsby, Nat Stapleton, and Vesna Stojanoska. I will describe 3 different perspective on tmf_*tmf (localized at 2). (1) the E_2 -term of the Adams spectral sequence for tmf tmf decomposes as a direct sum of ext groups associated to bo-Brown-Gilter modules, (2) modulo torsion, tmf_*tmf embeds into the ring of 2-variable modular forms, and (3) modulo v_2 -torsion, tmf_*tmf embeds into a product of $tmf_0(N)_*$, for various values of $tmf_0(N)_*$, and how they are related.
