

Departmental Colloquium

A theory for first- and second-order partial differential equations on junctions

Panagiotis Souganidis (University of Chicago)

Abstract: I will present recent developments about first- and second-order PDE on junctions. I will discuss some concrete applications, the well-posedness of the problems, as well as stability of asymptotic limits including fattening of domains. If time permits, I will also present some new results about scalar conservation laws along the same spirit. This is joint work with Pierre-Louis Lions.
